National Renewable Energy Laboratory, Golden CO

Why CPV?

- CPV offers an exciting new opportunity to apply new cell technology as a viable alternative to dish Stirling engines
- CPV advantages
 - potential for >40% cell efficiency in the long term (25% now)
 - no moving parts
 - no intervening heat transfer surface
 - near-ambient temperature operation
 - no thermal mass, fast response: annual ~ peak efficiency
 - concentration reduces cost of cells relative to optics
 - scalable to a range of sizes
- Various configurations possible
 - Large reflective dish with dense-packed array
 - Multiple, single cell concentrators (reflective or refractive)

Existing industrial examples

Solar Systems Ltd

- 20 kW Mark 1 (19%)
- 25 kW Mark 3 (130 m²)
- Sunpower Si cells
- Claim \$4/W installed system cost today

Amonix

- 25 kW MegaModule™
- 5 kW Fresnel-based modules
- High efficiency Si cells
- 500 kW planned for APS
- 16% average AC efficiency

Current Activities

- Flux uniformity
 - Uniform flux maximizes system performance
 - more important for dense-packed arrays
 - wired in series, cell with lowest flux drives array output
- Receiver development
 - Improvements in current dense-packed arrays
 - packing factor and packaging
 - thermal control
 - Innovative new designs
- System development
 - CTek/APS 2 kW dish
 - Amonix and/or Spectrolab array
 - SAIC dish retrofit/redesign for CPV

National Renewable Energy Laboratory, Golden CO

Flux Uniformity Status

- Evaluated and documented subcontracted analysis for reflective dishes with dense packed arrays
 - Duke Solar 
 - refractive secondaries
 - Optical Research Associates 
 - reflective secondaries, primary shape modifications
- Plenty of good ideas but will need to wait until programmatic funding issues resolved

Receiver design status

- Solicitation for 1 kW modules

- Amonix (current technology, robust cells)

- Dense-packed Si array, module packaging, water cooling, moving forward with hardware

- Spectrolab (high efficiency future, more developmental)

- Dense-packed multi-junction array, module packaging, water cooling, move to hardware this FY

- United Innovations (very high efficiency potential, highest risk)

- Unique cavity design using multiple cells, selective filters, move to hardware this FY

- Testing of modules at HFSF

- Designed/fabricating a secondary to deliver uniform flux

System Development Status

- CTek dish installed at NREL
 - Dish, drive, controller in September
 - Array, secondary, sun sensor expected December
 - APS trailer to follow
- Current test activities
 - Dish facet alignment
 - Flux mapping of primary
- Planned tests
 - Flux mapping of secondary
 - Array performance
- SAIC Dish redesign

Opportunities and Issues

- Continue component performance improvement
- Integrate components into improved systems
- Demonstrate performance and reliability
- Scale up to larger sizes
- Should continue a range of concepts
 - Multiple mini-concentrators
 - Dense-packed array systems
 - Innovative receiver designs
 - Expand thermal control activities
 - apply new technology to cooling of arrays
